PROGRAM 9

Write a PHP program named states.py that declares a variable states with value "Mississippi Alabama Texas Massachusetts Kansas".

Write a PHP program that does the following:

- Search for a word in variable states that ends in xas. Store this word in element 0 of a list named statesList.
- Search for a word in states that begins with k and ends in s. Perform a case-insensitive comparison. [Note: Passing re.I as a second parameter to method compile performs a case-insensitive comparison.] Store this word in element 1 of statesList.
- Search for a word in states that begins with M and ends in s. Store this word in element 2 of the list.
- Search for a word in states that ends in a. Store this word in element 3 of the list.
